FAQs

- 1 What is the difference between BigO notation and BigTheta notation BigO notation provides an upper bound on the growth rate of an algorithms running time while BigTheta notation provides both an upper and lower bound In other words BigO is a loose estimate while BigTheta is a more precise measure of the functions growth rate
- 2 What are the key differences between depthfirst search DFS and breadthfirst search BFS DFS explores a graph by visiting a vertex and then recursively visiting its unvisited neighbors BFS explores a graph levelbylevel visiting all vertices at a certain distance from the starting vertex before moving to the next level DFS is useful for finding connected components and 4 cycles while BFS is useful for finding shortest paths and minimum spanning trees
- 3 How does dynamic programming differ from greedy algorithms Greedy algorithms make locally optimal choices at each step hoping to lead to a globally optimal solution Dynamic programming on the other hand breaks down a problem into smaller subproblems and stores the solutions to these subproblems to avoid recomputation While greedy algorithms are often simpler to implement dynamic programming guarantees an optimal solution for certain classes of problems
- 4 What are the limitations of approximation algorithms Approximation algorithms do not guarantee optimal solutions but they provide a tradeoff between solution quality and computational efficiency The quality of an approximation algorithm is typically measured by its approximation factor which represents the ratio between the algorithms output and the optimal solution
- 5 How can I learn more about advanced algorithms and data structures Several resources are available for exploring advanced algorithms and data structures These include textbooks like to Algorithms by Cormen Leiserson Rivest and Stein online courses from platforms like Coursera and edX and research papers in the field of computer science
